The COVID-19 pandemic has changed nearly every aspect of human life, from the individual (how people live, work, keep their health) to the professional (how healthcare professional work). Unfortunately, more than three-quarters also approved that the pandemic created significant new opportunities for human growth, although this varies significantly worldwide. Of course, seeing the opportunities developing is not always the same as being able to seize them at times. Fewer than 50 percent of the healthcare professional feel confident that they are prepared to overcome the issues in the COVID-19 era. Most of the human aspect needs innovation in health preventing the long-term outcomes of pandemic. As might be honestly expected, they are focusing on maintaining healthcare system and its continuity, especially in hospital and community setting. Therefore, developing innovation in health driving productivity and implementing safety measures is needed during the never-ending pandemic. Leaders in healthcare sector should provide important strategy supporting innovation-led growth (Farrugia & Plutowski, 2020).
